

M-103

BLUE BOX

DESCRIPTION

- Fuzzes up your guitar signal, then duplicates it two octaves down
- You control output, plus the mix between the effect and dry signal
- Try it for attention-getting solos with huge, room-filling ambience!

DIRECTIONS

To set up the Blue Box, plug your instrument into the Input jack and your amplifier into the Output jack. Start with the Output knob all the way up (clockwise), and the Blend knob all the way down (counterclockwise). Turn on the effect with the footswitch toggle, making sure the red **LED** is **ON** to indicate that the effect is active. Then gradually raise the Blend knob to increase the amount of distorted signal mixed with your clean signal. Experiment with different settings, stopping when the desired blend of distortion is reached.

Once your distortion is set, adjust the Output knob for the desired output volume. You can start by toggling the footswitch on and off, and comparing the volume with and without the distortion effect. For many playing situations, matching the two volume levels is desirable, especially if you'll be switching distortion in and out while playing. However, you can also use the Output knob to **BOOST** the overall volume for a solo, by adjusting it so that the effected volume is louder than the clean signal.

Part of the charm of the Blue Box is that it creates two kinds of signals...those your amp can process and reproduce, and other tones that are completely indigestible and non-reproducible by your amp, creating interesting distortions. Every amp and every situation are unique, and will create different results with the Blue Box. Experiment with each new situation, and you'll soon learn what the M-103 is capable of.

If your guitar has multiple pickups, you may find that the Blue Box works best with the bridge pickup favored, and the neck pickup(s) rolled off. If you find that the distorted tones are causing too much breakup or distortion in your speakers, turn down the Blend knob to mix in a higher ratio of clean signal; or turn down the Output knob to reduce the overall volume coming from the unit. You can also use the Blue Box with a compressor (see M-102 Dyna Comp on Page ???) to even out the levels and protect your amp from gain peaks. When connected upstream of a compressor, the Blue Box will deliver the most controlled tones. When connected downstream of a compressor, the amount of compression will activate independently of the Blue Box's output.

POWER

Single 9 volt alkaline battery or Dunlop ECB03 AC Adapter

CONTROLS

- Footswitch toggles effect on/bypass (red LED indicates on)
- Output knob sets total output gain
- Blend knob adjusts ratio of dry (clean) with wet (effects) signal
